G3 Installation: Process to add a new property using FOLS

Overview

This process is part of the Installation and onboarding activity for a property using G3 RMS with the FOLS integration.

Purpose

Follow the steps mentioned in this document in order to set up a system using G3 RMS with FOLS integration.

Intended Audience

The Installation team or any member who is installing or adding a new property into the system.

Pre-requisites

Entry criteria

- Add property in G3 as per normal process outlined below.

Check that the following are in place before execution of the Add Property task.

1. A case is opened by the Client Project Manager (CPM) for CARE such as the one below for Data Capture /Installation for G3. The first step is “ADD A

This case subject mentions that this property does not have Component Rooms. If the property is using Component Rooms feature in G3, the CPM must state the same.

1. In which configuration details are provided on the case itself. These are Case modules. The check box for the respective modules should be ticked “”. You will also find BDE and IDP information as well as the data extraction window, What-if, Analytical Market Segments (AMS), etc. These are needed for configuration which is a major step in the installation of a new property.

- **For FOLS, the case will not have a form attached. Follow the normal add property process and prechecks explained below to verify case details. The modules should be checked as mentioned on the case. Once property is added, follow the steps detailed in the section “*For a property using FOLS use the following steps*” to enable parameters.

The following configuration details are contained in the case comments and on the case under “Application Configuration and Modules”:

1. Client name
2. Client code
3. Integration
4. Chain code from SFDC (first four digits of the Client Account id)
5. Hotel name
6. Hotel code (last 4 digits of the Account id)
7. Whether the property is Limited Data **Build**
8. Currency
9. Time zone
10. BAR configuration

Procedure

Input Validation

- When the case is received, after completing the checks above, see whether the property exists in G3 RMS **UI** in Prod 2 and Prod 3.

- To do that, pick up the client name from the Account section on the case. See Ultimate Parent Account.

- Check the G3 Client Code. If the property already exists in G3, this field will be empty.

- Check if any other property exists with the same account number on Prod 2 and 3.

To do that, copy the Account Number from the account section on the case in SFDC and paste it in the box titled 'SFDC Account #' in the 'Property' tab of the 'Installation' screen in G3 RMS UI. Click 'Search'. **Note: If a property exists with this Account number, reach out to the CPM and do not proceed with the next steps for the 'Add Property' task.**

- Once the Client name is found in either Prod 2 or 3, start the 'Add Property' steps in the respective prod.

For example: Ascott can be seen in Prod 2.

Process:

- Click 'Add Property' the window shown below will be displayed. Here the required details need to be entered. The fields marked with a * are mandatory.

Refer to the **SFDC case** to get the information needed:

1. You can copy or use the drop-down arrow to select the Client.
2. When entering the Account Name, ensure the name matches on both Case level and Account section in SFDC.
3. Enter the Account number from SFDC.
4. Enter the Property Code.
5. Enter the Property Time Zone (can also be seen in the Account screen in SFDC).

If there is a difference in the time zone on the Account screen vs the form, refer to the form for the time zone.

1. Yield Currency
2. Estimated capacity (total units)

3. External System. This parameter is set on Client level.
4. Select Sub System from the dropdown.
5. Whether or not the property is Limited Data Build (LDB). Sometimes a separate case and workflow exists for LDB but this information is also mentioned in the case comments. The information will also exist in the Form.
6. Don't forget to click 'SAVE'.
7. Now check the inputs in each field for spaces.

This is what the completed configuration form will look like:

Note: If a property is migrating from G2 to G3, it may not be necessary to check the box next to 'Migrated from G2'.

There are separate steps to be followed if a property is migrating from G2 to G3.

- After clicking 'SAVE', there will be a job which will run for approx. one minute.

Come to this screen to see the job status:

- Under Filter Jobs, select Add Property.
- Under Status, highlight all.

- This is the output

- Now check the property with the SFDC account code and click 'Search'. The record will display.

- Click the Property code (in blue). The following will display.
- Ensure that the status of the job is complete. If it is still running, it will not show up in the UI.
- Now when a search is carried out for the property by entering the Account Number, the property will show up.
- After the job is complete, under Edit Property Data, select Connectivity Location from the dropdown as 'Hotel' and Transport Mechanism Type as 'Any Other'.
- Now with this the property is added. The next step is the Configuration.

- Copy the selected row into Notepad for your reference.

Configuration:

Refer to the form and the modules selected on the SFDC case.

1. CORE SETTINGS on the UI

- BAR configuration: Use the dropdown to select the BAR Pricing Method.

BAR by Day/ BAR by LOS/ Continuous Pricing (Most hotels use the third option)

This needs to be verified in SFDC as shown below:

- Limited Data Build (LDB) – Already checked and set up
- Group Wash By Group – is selected by default. However, this needs to be checked in SFDC as seen in the screen shot. If the module is selected in SFDC, then either retain or remove the selection on the configuration screen in the UI.

- Group Pricing – Selected on the UI Configuration as well as in SFDC.- as per licence
- Function Space – as per licence

- What if
- For some configuration like IDP – chain standard will be followed.
- Extended stay – for some chains, this toggle is enabled by default.
- Analytical Market Segments – Not applicable for LDB properties

In case of any mismatch between the UI and SFDC, the CPM must be contacted.

- Once this is complete, please click SAVE.

2. INBOUND on the UI:

- There are a total of 8 parameters.
- For Data Windows, check the BDE parameter information on the Case comments.
- Change the values in the fields shown as required based on the information as per chain standard or as mentioned in the Case comments.
- Currency Codes:

1. RMS Currency Code is the same as Yield Currency (refer to the HTNG form)
2. Base currency is the currency at the location of the property.

In case both currencies are not the same, then there is a parameter which is 'Apply Yield Currency' which needs to be enabled. This will enable currency conversion in the backend.

- Base Occupancy – Select Single or Double
- Pseudo Room Type codes

This is updated as per the information on the case,

For FOLS then the client completes the Integration questionnaire and the values get updated.

If these room types are not configured, these Room Types will come to G3 and will show up on the UI. By adding these room types in the configuration, G3 will not show these room types in the UI.

This completes the Configuration.

3. Configuration Tab in G3 UI

- On the Property tab enter or change the property code. The property name and Client will be displayed.

In the search box enter 'pacman.forecasting.forecastwindowCDP'.

This will filter out the 'pacman.forecasting.forecastwindowCDP'.

Check the values for the CDP forecast window and CDP Optimization window.
Change the values on the UI accordingly. In the Reason For Change dialogue box, mention the case number.

This completes the 'ADD PROPERTY' activity.

For a property using FOLS configure additional parameters below:

1. Update below parameters in property configuration in G3.

pacman.feature.folsBaseUrl – <https://fols-internal.ideasrms.com>

pacman.feature.pmsInboundBaseUrl – <https://pmsinbound-internal.ideasrms.com>

Update parameter pacman.feature.enableMultipleNGIConfigurations = true.

Update Vendor Configuration

Update vendor parameter form through NGI Settings page on URL:

<https://ngi.int.setting.admin.ideasrms.com/dashboard>

search for the property on the NGI Vendor Page and open the parameters form by clicking on the cloud button on the left:

Re- validate changes are being made to the correct property code in vendor page.

Search and Update the parameters “Install mode”, “Future days” and “FolsUseCoudProcessing” as below:

Ensure you update the parameter values at PROPERTY LEVEL only.

Exit the NGI Vendor page

- Close the ‘Add Property’ task.
- Complete ‘Vendor Configuration’ task

Closure

•Complete ‘Peer Review’ task

Escalation Path

- Client Project Manager
