G3 Market Segment (AMS) Recoding

Overview

This process is part of the Installation and onboarding activity for a property using G3 RMS.

Purpose

This process document provides up to date information on Products, positioning, installation, and support for our G3 AMS Recoding functionality. Along with this, it also provides insight and tools for Client Operations to successfully guide a client through the recoding process.

Intended Audience

ICS Team / Client Operations works one-on-one with the client to provide insightful guidance on the process to successful conclusion of an AMS Recoding process.

Scope

This section should clearly outline what the intended scope is – because documents can be very long and contain too much information without boundaries. Setting scope will aid defining boundaries.

Step 2: Concept, Qualification and Functionality

Concept:

Let's start with Analytical Market Segments as a whole:

IDeaS developed Analytical Market Segments (AMS) to provide our clients with the **benefit** of a more refined way to approach their segmentation within the G3 RMS. IDeaS AMS functionality allows the user the ability to attribute data “By Rate Code and Market Segment” combinations. Instead of applying generic rules to segment buckets, AMS enables better, more precise optimization and reporting for transient businesses as G3 considers both pricing and rate availability as part of its forecasting and decision/controls. The **value** to G3 RMS users is that our AMS functionality results in more refined conveyance of the expected behavior of each reservation transaction, setting an industry-leading RMS a step above our competitors and leading our clients in **achieving** their revenue **goals**.

Why might clients need to recode:

Simply stated, the RMS now has a mechanism whereby a client can change their Market Segment structure and the RMS will recode its historical data to the new structure, quickly and efficiently – no conversion tables, charts or summing of past/future segmentation required!

If the client is also a user of our Optix product, we have worked with the Optix Team to have the same impact within Optix – Historical data represented in the new

Market Segment/Rate Code structure for the same benefit to our RMS and Optix clients – see Step 20 within [Step 5 Installation](#).

Qualification:

- Property must be non-LDB and a standard build only.
- **An SOW will be required for this activity and must accompany the associated Product within the Opportunity as outlined in Step 5 – SOW Template: AMS Recoding** and is via the [Client Operations SharePoint](#) page
- Hilton will be exempt from this process

Functionality:

This product is for properties that will change their Market Segment and/or Rate Codes and will require IDaaS to clean up the existing property data and re-build all summary and pace data. This product will clean up historical data in the RMS to ensure business continuity. Clients who want to change their existing MS and Rate Code structure and moving forward do not want to see the old structure in G3 RMS can opt for this functionality. This product will clean up historical data in the RMS to ensure business continuity. In the past, our only option was to have the client assign the new/future Market Segment/Rate Code structure ('oranges') into the same Forecast Group as the historical Market Segment/Rate Code structure ('apples'). This past solution would cause client issues when comparing historical performance with future performance in the RMS reporting and would not provide single Market Segment granularity for analysis. With this new functionality, we can recode the past structure to represent under the new structure – past 'apples' will report under the new/future 'oranges' structure.

Step 3: Positioning

Cautionary Points:

- **From the client perspective, this is a “Market Segment Recoding” as the term “AMS” is mostly an internal term. In your conversations with clients, it is suggested to NOT use the term “AMS” as this is inconstant with UI and Help language.**
- ***Suggested: “Market Segments” and “Split Market Segments at the Rate Code-level”***
- The client should expect 5-7-days of RMS/System Downtime to complete this activity
- The new MS structure should not be enabled prior to running this activity. If the segments are introduced before the recoding, this tool will not properly recode the historical business.
- Cyclic Attribution is not handled e.g., CMPHSU is to be recoded to XYZ, but XYZ is also being recoded to ABC. This will error when uploading back into RMS

Current Code	New Equivalent Code
CMPBUS	NEW_1
CMPBUS	NEW_2
CMPHSU	XYZ
XYZ	ABC

- Group to Transient and Transient to Group changes are not handled (*Under development*)

- CRM/ CPM will need to qualify and confirm the MS recoding spreadsheet prior to run the recoding tool, considering the limitations.

Integrations Supported:

- All Integrations are supported; changes are being made in the G3 RMS Interface

Outbound Integrations Supported:

- N/A

Step 4: Products/Opportunity

In addition to the product contract – a Statement of Work (SOW) for this activity must also be completed and attached to the Opportunity prior to commencing work on this activity.

Product	Name/Link
G3-RMS-SVC-RECODING	This product is for properties that will change their Market Segment and/or Rate Codes and will require IDEaS to clean-up the existing property data and re-<u>build</u> all summary and pace data. This product will clean-up historical data in the RMS to ensure business continuity. One-time fee for properties that will make changes to their Rate and/ or Market Segment Codes in the Primary Inbound Data source (PID) for IDEaS G3 RMS. Fee is per hotel.
SOW Template	SOW Template AMS Recoding (Required) <i>Download copy of Template – then edit please</i>

Procedure

Step 5: Implementation

Clients will require IDEaS assistance with each step in the process. Multiple points of support/contact should be expected.

Step 1 – Set case/task for ICS to enable Parameter:

pacman.feature.MSRecodingEnabled to = 'TRUE' at Property-level.

- *Case Type: **Installation***
- *Product Family: **G3 RMS***
- *Case Reason: **Installation Other***

This will allow for generation of the Recoding Template from the G3 RMS Installation screen – open MS Recoding tab and complete the below – with determination of Template-Type and Last Extract Date.

1. a) Only Generic Template can be selected.
2. b) The last Extract date is the day by which we would expect that the client would be switching the Market Segments in PMS (deactivating old and activating new).
3. c) On the date configured, after BDE Processing has completed – the Recoding Job will be triggered (Monitoring Dashboard)
4. d) The Job will fail (expected) with first step of *“validateRequiredMktSegRecodingConfigurationStep”* as no MS Recoding Configuration Template has been uploaded (old to new)

Step 2 – This will generate a client-visible RMS Alert. Once Alert is triggered the RMS will automatically be placed in **Dormant Mode** (extracts will be archived). This will be the starting point for the expected 5-7 days of RMS/System Downtime

Client is then free to add the new Market Segments and transfer all future reservations to the new Rate Codes/Market Segment (Code) combination structure in the PMS.

Step 3 Clicking on the link to the PMS Migration Link will direct the User to the Recoding import/export module (*Configure>Recoding*) to allow the client to export the current.

Step 4 The exported template will include all current Transient and Group Market Segments as well as all Rate codes:

Step 5 Client will update the New Code column. If no change for a current Rate Code is desired, repeat the Current Code or leave Blank – no recoding of this Rate Code will take place.

Step 6 For the 'Data is invalid – delete the history' column, client can select via pick-box if to "Remove and permanently delete the history". This is only applicable to Market Segments and caution should be used as there is no validation by IDEaS as to if Market Segment contains history or is applied to any Block Codes.

Step 7 For the 'Is Primary Code for One-to-Many Splits' column – if a current Market Segments is being split, the client must indicate (Yes or No in the pick-box) which new Code (Market Segment) is the Primary Market Segment and all historical transactions will be historically recoded to the Primary. The non-Primary code will only be used for future business (with expected Alert for new Market Segment with CCFG requirement) – see example below:

- If merging Market Segments – simply list the Current Codes with a single Market Segment in the New Code column.
 - Template includes instructions tab with link to the Help text

Step 8 – Import Template back into the RMS. If any validation errors exist in the upload – the RMS will display, otherwise receive a successful import message – Choose File>Import.

That enables a new, second tab: "New AMS Configuration":

Step 9 User clicks to export the current Attribution template. In the template, user edits with the intended changes to Market Codes (Market Segments), Rates Codes (only for any split MS attribution – if 'straight in' MS – no Rate Code is required), Attributes, and Forecast Type.

- If Rate Code field is blank – it would be considered as straight-in Market Segment.
- If splitting one Rate Code from a Market Segment with updated Attribution, list as such, then indicate the Market Segment again, and indicate **DEFAULT** in the Rate Code Column. All non-defined Rate Codes will then be attributed to the current default attribution.

Step 10 – User Imports the completed attribution template.

Step 11 – Validate and accept the Confirm Shifting of Rate Codes pop-up.

YES, if the association of the Rate Code(s) is correct from the previous association to the new association. If **NO**, it will remain with previous association and/or change Attribution Template.

Step 12 – If applicable, Confirm Undefined Rate Codes to Default Attributes.

Selecting **YES** will complete the upload and subsequent success message.

Step 13 – User goes back to Alert, checks the “I have provided the required configuration” box. Processing resumes (35 to 90 min to complete).

Step 14 – NEW ‘Post Backfill Data Validation Alert’ – needs to be assigned to CARE team for action

Step 15 – Client receives RMS Alert to complete CCFG Task

Step 16 – Client completes CCFG

Step 17 – Recoding job is completed at backend. ICS to review the feed and confirm if the updated Market Segment (Code) changes are reflected in the latest feed.

Ensure to Enable mixed extract Parameter –
'pacman.PreProduction.PopulateStraightand
GroupMSInYCBRForMixedExtract'(This should avoid old MS re-appearing in G3 in
case old segments are received with BDE.)

Catches up property and switches back to Decision Creation Mode.

Step 18 – ROA to perform system review and share the details with CPM/CRM.
CPM/CRM will share the analysis with clients and ask them to review forecast and
decisions. If the client is happy with decisions, CPM/CRM to inform ICS to change
property into Decision Delivery Mode

Step 19 – ICS to resume Decision Delivery Mode

Note: The RMS will retain historical reference of the original Market Segment (Code)
and Rate Code by selecting the drop-down in the Market Segment Module. This will
also support if, by chance, an old Market Segment (Code) is later presented to the
RMS, it would follow the mapping logic of the recoding.

Step 20 – If property has **Optix**, set additional case under 'G3 Optix – Other' and task
for full historical repopulation of data from G3 into Optix (Do not change/extend the
past days in G3 RMS)

Tool Type	Name/Link
Help	Recoding Market Segments

Step 6: RMS Configuration

If the Client should have any scheduled reports with configuration inclusive of pre-recoding Market Segments or Forecast Groups, they may need to update the report configuration to reflect the post-recoding environment

Client should review their RMS configuration of both Corporate and Property of Business Views to reflect the new attribution.

Step 7: Forecast and Decision Review

Per step 15 of [Step 5](#) Installation, our ROA Team will complete and provide a post-activity System Review including Forecasts and Decisions. If the client should express concerns related to the outcome of the recoding and/or the ROA Analysis, please open a case/task with ROA to address.

Step 8: FAQ / Best Practices

It is highly recommended that a client reviews the available Discover courses in advance of the recoding activity, this will put them in the best position to correctly and accurately configure this important foundational element within the RMS.

Three Guiding Principles of interacting with the RMS

- Does the System know the truth?
- Does the System know what you know?
- Do you know what the System knows?

Escalation Path

- CPM
- CRM
- QA
