G3 Process Completion Metrics

G3 CMA Process Completion Metrics Report Query

- How to run the query
 - Login to CMA at <http://us2p3ta01.ideasprod.int:8280/cma/runSql/runSql>
 - Go to SQL > RUN SQL and ‘fetch’ a query saved as Process Completion Metrics Report

Categories

Select Category

- In the Run screen – make sure you select the chain as ‘global’ and then hit run query like so

SQL Reports Parameters File Explorer

Run SQL View SQL View Scheduled SQL Edit Scheduled SQL

Run SQL

Selected Query: **Process Completion Metrics Report**
 SFC Case: **Get**

Select Chains: **1**

Selected Delimiter:

Query Description: G3 report equivalent to SWB Process Completion Metrics report
 1) "Query 1" shows the current stage count
 2) "Query 2" Process Completion Metrics across System Modes
 3) "Query 3" Process Completion Metrics for One Way and Two Way hotels
 4) "Query 4" Process Completion Metrics by Stages

Query Set:
 select Stage,COUNT(*) as No_Of_Hotels from property group by Stage order by Stage;

 SELECT DateandStage,[Before 8],[Between 8 to 9],[Between 9 to 10],[Between 10 to 11],[Beyond 11],[NOT_RECEIVED],[IN_PROGRESS],[DATA_COLLECTION_IN_PROGRESS],[SKIPPED]
 from
 (
 select DateandStage,completedby from (
 select Processing_Date as DateandStage,
 CASE
 WHEN DATEPART(hour,Completed_DTTM) <8 THEN 'Before 8'
 WHEN DATEPART(hour,Completed_DTTM) >8 and
 DATEPART(hour,Completed_DTTM) <=9 THEN 'Between 8 to 9'
 WHEN DATEPART(hour,Completed_DTTM) >9 and
 DATEPART(hour,Completed_DTTM) <=10 THEN 'Between 9 to 10'
 WHEN DATEPART(hour,Completed_DTTM) >10 and
 DATEPART(hour,Completed_DTTM) <=11 THEN 'Between 10 to 11'
 ELSE 'Beyond 11'
) as DateandStage,
) as completedby
)

Query Parameters:
Run SQL **Schedule SQL** **2**

- Once the query has executed – it should get you a job id , which when completed – should give you an option to export. You ‘must’ click on the job ID that gives you the entire list . The export button should look like below

My Tasks My Team Tasks

Details for Job Id 6387

Export

Chain	Stage	No. Of Hotels

global	02 Sep 2017 DataCapture	444	4	1	1	11	4	4	4	1

- Understanding /making sense of the report
 - The generated report would have 8 sheets and each sheet will come out with a leaf name as Query 1 , Query 2 etc upto Query 8. This should look like below
- Moving forward- each component will be illustrated/detailed under its own header as below:
 - Query 1
 - This gives you a sense of how many properties are installed overall on that PROD and what are their system modes. This should help you determining scopes of impact particularly

when major issues occur – so that you can easily prioritize one over the other.

■ Query 2

- This is the near equivalent of the Process Completion Metrics Report that is in G2 SWB and gives you number of properties that processed before 8 am local time and from 8 am upto 11 am for 3 days .
- You should sum up I2 and I3 to know how many properties from past continue to be inprogress mode AND J2 and J3 to know how may properties continue to be in data collection for past 2 days.
- Summary of C2 through K2 should give you the number of properties that the G3 applications sees everyday.
- you can extend this summary to C3 through K3 and C4 through K4 to get a general sense of number of properties .
- If you see a large drop in this summation – either a large chain de-installed or there's an issue with the quality of the data being returned. you should review any recent changes before escalating to the TechOps for resolution.

■ Query 3

- This is an extension of the above query – but limited for only one way and two way properties.
- Insert a new column by the name “Current number of properties” as Column C
- Copy the number of 1 way and 2 way properties from the Query1 sheet – C5 and C7
- This should be done consecutively for each day – so 3 entries for 2 values makes a total of 6 new entries
- This column will serve as a near approximation to how many 1 way or 2 way properties processes on given days .
- You can now easily compare column C and D to see generally how well the properties process over time.
- Beware : Cell D6 & D7 WILL vary largely based on when you run this query – so if you're looking at it in the early morning hours IST , like a 6 or 7 am -then you'd expect a smaller number – however as the day progresses – and you're say at 7 PM IST – these numbers i.e column C numbers should be closer to numbers in column D – if not – you've a problem at hand. Please identify via either monitoring screens as to what real time issues are and escalate suitably.

■ Query 4

- This is an extension of Query 3 for properties of all site status for 3 days.

■ Query 5

- Apply a filter on all columns
- This gives you a list of names of properties that processed well after 11 am and gives you a retrospective advantage of what transpired in the recent past.
- You may want to undertake the following :
- Preventive measures that can be initiated :
 - Exclude from the Stage column – Dormant
 - This should give you a fair list of known properties that have had an issue recently – resulting in delay – so you can quickly cross verify with your wunderlist if issues exists and notifications have been issued to the client for the same or not.
 - if it has not been actioned or detected – first step should be to notify client and also initiate why an issue is not detected.
 - Also identify an RCA for non availability (this would be a very rare scenario – but should be – if issues are

experienced)

- Query 6
 - This gives you a list of all properties that not completed processing for past 3 days with various system dates. (typically 3 days – if all properties completed processing – this would be empty).
 - Use the following :
 - There are 4 types of status in the status column which are as follows :
 - DATA_COLLECTION_IN_PROGRESS
 - IN_PROGRESS
 - NOT_RECEIVED
 - SKIPPED
 - Put filters to the report
 - Apply filter as following :
 - Two way properties :
 - Current Date :
 - Filter to select Two way properties
 - Filter in Status to include only Not received and skipped
 - Filter in finally today's date –
 - This should give you a fair list of known properties that have an issue – however they may or may not be resolved – so you can quickly cross verify with your wunderlist if the issue exists and notifications have been issued to the client for the same or not.
 - if it has not been actioned or detected – first step should be to notify client and also initiate why an issue is not detected.
 - Also identify an RCA for non availability (this would be a very rare scenario – but should be – if issues are experienced)
 - T-1 OR Yesterday
 - Apply the following filters
 - Filter to select Two way properties
 - Filter in Status to include all statuses
 - Filter in finally Yesterday's date –
 - This should give you a fair list of known properties that have an issue – however they may or may not be resolved – so you can quickly cross verify with your wunderlist if the issue exists and notifications have been issued to the client for the same or not.
 - if it has not been actioned or detected – first step should be to notify client and also initiate why an issue is not detected.
 - Also identify an RCA for non availability (this would be a very rare scenario – but should be – if issues are experienced)

- T-2 OR Day before Yesterday
 - Apply the following filters
 - Filter to select Two way properties
 - Filter in Status to include all statuses
 - Filter in finally Day before Yesterday's date –
 - This should give you a fair list of known properties that have an issue – however they may or may not be resolved – so you can quickly cross verify with your wunderlist if the issue exists and notifications have been issued to the client for the same or not.
 - if it has not been actioned or detected – first step should be to notify client and also initiate why an issue is not detected.
 - Also identify an RCA for non availability (this would be a very rare scenario – but should be – if issues are experienced)
 - Apply the above process for One way and population properties and action all outliers.
- Query 7
 - This list gives you a list of all properties that took excessively long to complete processing and the last column indicates how long.
- Query 8
 - This is the **most** useful query from an Operations perspective
 - This gives you a list of properties that are experiencing continued processing issues for past 3 days. Note this will include data capture/paused/Dormant state properties. You should typically filter out Data Capture , Paused and dormant state properties
 - This is equivalent to the NCP list in G2 .
 - The properties in this list should already have had typically been notified of issues and should be present on Wunderlist.
 - Where ever applicable escalations to QA should be initiated and tracked .
 - A report must be published everyday to Ranjit.Phatak@ideas.com notifying of the status .

Hi yogi,

Can we have an additional tab which will include chain wise properties which is done with the decision upload?
