G3 – Opera Full decision upload during CDP

If CRMs raises a request to perform Full Decision Upload with urgency for opera property of which CDP optimization has been executed, then the below steps should be used to complete this task. Note that CRM’s may request upload to only one channel like PMS . One should clearly distinguish the selling channels and must make changes in line with this request.

Please follow below steps provided by QA to complete this:

Go to Support>Configuration> Select the ‘correct’ property.

- 1) Set [pacman.optimization.optimizationWindowCDP]= Should be identical to the BDE Window at property level, typically 365 or 396.
- 2) Set [pacman.integration.opera.DailyBAR.uploadtype] = Full at property level.
- 3) Set [pacman.integration.opera.RoomTypeOverbooking.uploadtype] = Full at property level.
- 4) Set [pacman.integration.opera.HotelOverbooking.uploadtype] = Full at property level.
- 5) Re-run the CDP feed from Process Data Feed of Property details popup.
- 6) Monitor the job and ensure decisions are uploaded to all channels. Ensure that this is
- 7) Once the decision delivery job complete revert all set parameters at property level:
Delete value of [pacman.optimization.optimizationWindowCDP] from property level.
[pacman.integration.opera.DailyBAR.uploadtype] = differential
[pacman.integration.opera.RoomTypeOverbooking.uploadtype] = differential
[pacman.integration.opera.HotelOverbooking.uploadtype] = differential

Could you review the above and check? While re-running a CDP, Forecasting step doesn't run and hence this approach will only refresh selling systems based on the newly increased CDP optimization window.

The current process used to forecast during a CDP is to use the forecast from the most recent BDE run. This forecast already accounts for expected bookings during the period between BDE completion and the time of the CDP run and the CDP process then accounts for the current on-books position observed at the time of the CDP run. This process allows IDeaS to support multiple CDP's throughout the day (without loss to forecast accuracy), helps ensure that properties are able to access their latest property data without G3 RMS being locked for extended periods due to re-forecasting and also avoids G3 RMS reacting aggressively by re-forecasting due to changes for the CDP window.

thank you so much for checking the above – but I still find the forecast steps getting skipped during CDP data load job. I even tried uploading decisions with the above approach keeping the sync flag on – but no luck.

Further, I think (not sure) the aforementioned description of CDP functionality updates the On books data along with certain section of our G3 UI – which might be not related to what we're trying to achieve here.

The forecast used in CDP is the forecast from the 'most' recent BDE – so a skip ini CDP , would be expected. Pertaining to your second observation , the intent of a full decision upload is to bring parity to a single , many or all channels that a hotel subscribes to and this procedure outlines that. G3 CDP processing is an entirely different process – this is post is limited to describing a full decision upload and NOT the CDP process. Hope this is helpful.
