G3-Opera agent Exceptions and Solution/fix

This document will give you an insight of the issues that we usually encounter during Processing in G3 Opera Properties. Here, we have taken most common failures that we have encountered. CARE can use this as a reference document for investigating the failures and then can take the appropriate action.

1] Job Name : Opera CDP Data Load

Step Name : operaLoadStagingTablesStep

=====

Tetris Errors: [34 – DATABASE_EXCEPTION – Error loading staging table from [Raw_Transaction]. –
User.id: null – Workcontext: null] Cause :
javax.ejb.EJBTransactionRolledbackException: org.hibernate.exception.
SQLGrammarException: could not execute statement Cause :
javax.persistence.PersistenceException:
org.hibernate.exception.SQLGrammarException: could not execute statement
Cause : org.hibernate.exception.
SQLGrammarException: could not execute statement Cause :
com.microsoft.sqlserver.jdbc.SQLServerException: Conversion failed when
converting date and/or time from character string.

- HLTN/Handling Error for SAS Dataset Encoding Job

- The error occurs as the feed that we have received has at least one entry that has wrong data.
- In order to resolve the error, we can try to create a new feed and check if it goes through.
- In case the issue persists even after adding a new feed, kindly escalate the task to QA, as they will manually change the date.

2] Job Name : Opera Data Load

Step Name : operaLoadTenantCreateFileMetadataStep

=====

Tetris Errors: [0 – UNEXPECTED_ERROR – Error Inserting OperaDataLoadService FileMetadata – User.id: null – Workcontext: null] Cause :
javax.persistence.NonUniqueResultException: result returns more than one elements

=====

- This error normally occurs due to reprocessing the extract which is already processed and was not completed successfully.
- Whenever we copy the data from history to Raw, Incoming File_metadata entry is added to File_metadata
- So when, it tries to find the entry in File_metadata table, it finds a duplicate record so more than one elements are returned.
- Thus, multiple records are present for 1 ID in stage_incoming_metadata table and raw_incoming_metadata table, and it tries to insert duplicate entry in the file metadata table as there is multiple selection for 1 metadata_id.
- Solution for this is to check whether there is a duplicate entry in Stage_incoming_metadata table and Raw_incoming_metadata table.
- If the duplicate entry exists, then ask the TechOps to delete the duplicate entry from both the tables, and then resume the job.

Do not abandon the job in this scenario, as it may cause discrepancies in the data.

3] Job Name : Opera Data Load

Step Name : operaFilterUnwantedRoomTypesStep

=====

javax.ejb.EJBTransactionRolledbackException:
org.hibernate.exception.ConstraintViolationException: could not execute statement Cause : javax.persistence.PersistenceException:
org.hibernate.exception.ConstraintViolationException: could not execute statement Cause : org.hibernate.exception.ConstraintViolationException: could not execute statement Cause : com.microsoft.sqlserver.jdbc.SQLServerException:
Cannot insert the value NULL into column 'Mkt_Seg_Code', table '990342.dbo.Mkt_Seg'; column does not allow nulls. INSERT fails.

=====

- This issue arises as there are blank market segment entries received.

Ranjit on [Service Recovery Procedure – IDeaSOperaAgent Service in “Stopping” State](#)

Ranjit on [Processing Failures Due to Data Type Mismatch for MGM Resorts](#)

Ranjit on [Accor Client Handling Process Guide](#)

- Client-Side issue where market segment received as blank.

How to check the blank market segments?

1. Go to G3 CMA->Run the Query name – “Find out Reservation in FULL with Blank Room Type or Blank MS of received transactions”
2. Once the query is complete, export the details of the query.
3. Check for Confirmaton_Number column and Market_Code column.
4. You will find Market_Code column empty.
5. Highlight both the columns in Yellow and send the email to the client.
6. Attach the downloaded file to the email.
7. Once we receive the information from the client, we need to assign the task to QA to update those records in the current feed.

4] Job Name: Opera Data Load

Step Name: operaLoadTenantGroupDataStep

```
=====

javax.ejb.EJBTransactionRolledbackException:
org.hibernate.exception.ConstraintViolationException: could not execute
statement Cause : javax.persistence.PersistenceException:
org.hibernate.exception.ConstraintViolationException: could not execute
statement Cause : org.hibernate.exception.ConstraintViolationException: could
not execute statement Cause : com.microsoft.sqlserver.jdbc.SQLServerException:
Cannot insert duplicate key row in object 'dbo.Pace_Group_Block' with unique
index 'UQ_Pace_Group_Block'. The duplicate key value is (19153, 2018-09-21, 25,
2018-05-14).
```

- ```
=====
```
- This error comes, whenever we try to process group data, and try to add group data into Pace Group\_Block table in G3.
  - this error comes, if we try to reprocess the extract, and the earlier BDE extract is already complete, and has already added a BDE entry and a group entry for a particular business date
  - In the error mentioned above “(19153, 2018-09-21, 25, 2018-05-14)”, 19153 is a group id in G3, 2018-09-21 is the occupancy date for which we try to add a date into Pace table.
  - In this scenario, we need to check whether it is a duplicate processing job or not. If it is not duplicate processing, then we have to verify, where the duplicate records are present.
  - We can skip the extract, and also can escalate it to the client that we are receiving duplicate records and ask them to correct it from their end.
  - Also, we can abandon the current process and trigger new CDPOperadataload job.

5] Job Name: Opera Data Load

Step Name: operaLoadTenantReservationDataStep

```
=====
```

Tetris Errors: [34 – DATABASE\_EXCEPTION –  
javax.ejb.EJBTransactionRolledbackException:  
org.hibernate.exception.ConstraintViolationException: could not execute  
statement – User.id: null – Workcontext: null] Cause :  
javax.ejb.EJBTransactionRolledbackException:  
org.hibernate.exception.ConstraintViolationException: could not execute  
statement Cause : javax.persistence.PersistenceException:  
org.hibernate.exception.ConstraintViolationException: could not execute  
statement Cause : org.hibernate.exception.ConstraintViolationException: could  
not execute statement Cause : com.microsoft.sqlserver.jdbc.SQLServerException:  
Cannot insert duplicate key row in object 'dbo.Individual\_Trans\_Table' with unique  
index 'UQ\_Individual\_Trans'. The duplicate key value is (955906, 991070, 2017-06-  
26).

=====

- This error usually occurs when there is some missing transaction in the extract that we have received.
- In order to resolve the issue, try to add new feed for the property.
- If the issue still persists then follow the below mentioned steps and accordingly do send an email to the client.

- a. We can use “Check the problematic reservation for Duplicate key issue in stage table” query in CMA to find out the missing data in the extracts with the reservation string 955906, as per the error above.
- b. Based on the results of the query, our steps to fix the error would change.
- c. If we have missing record for certain transaction date, then we would change the “pacman.PreProduction.OperaCorrectMissingTransactionEnabled” to true and then change the “pacman.integration.opera.pastDays” to 45, and request for a new feed.
- d. IF there is no missing transactions then it’s an issue of share resolution so our first attempt would be to change the ResolveSharewithRTchnages parameter or we have to update the share information of reservation.
- e. In this scenario we would change the “pacman.integration.opera.resolvesharerswithRTchanges” to False and then change the “pacman.integration.opera.pastDays” to 45, and request for a new feed.
- f. Furthermore, once the new feed is created, and the property is processed successfully, you may mark the failed datafeed as invalid, as this might cause problems during rollback and catchup in the future.
- g. In order to mark the failed data feed as invalid go to **Installation Screen -> Data Loads ->Select the failed data feed->Actions->Invalid**

6] Job Name : Opera Data Load

### Reason-

The issue could be of due to timezone change during DST.

### Action item-

- a) Please do ask client to set the correct timezone of agent installed machine or Take remote access and try changing the time zone (If this does not work, go for point 1)
- b) Perform tzupdater (If this does not work, go for point 3)
- c) Re-install with LATEST installer [ should result in a updated timezone database java version that correctly understands dates]

### Example:

Similar issue had happen on 27/28th March 2019 for Four Season Sao Paulo [Case#02960769], refer solution below:

\*\*\*\*\*

Hi Vinay,

*Last year Brazil changed the date on which DST starts to be the first Sunday in November. We now have a reservation for Nov 3, 2019, but when the occupancy date is read from the temp tables in Oracle it is being interpreted as Nov 2, 2019, and so the agent is producing two summary records for Nov 2, 1019.*

*As part of US36953, the agent installer was upgraded to a java timezone database that includes the change made by the Brazilian government. This change is part of the JRE included in the installer, it is not part of the agent WAR itself. Therefore, updating the agent WAR will not update the timezone database.*

However, uninstalling the agent (not just the agent WAR), and running the LATEST installer (having the updated timezone database), should result in a java version that

correctly understands dates around Nov 2.

Therefore, I would recommend deploying the latest agent installer to Sao Paulo, re-installing the agent (applying the existing configuration), and re-pulling the feed.

If this works, it should continue to work forever (or until the next time the laws in Brazil are changed).

Regards,  
Tom Crider

Point 3;

We have a query to update the blank market code.

“Opera Agent – Update Blank Market Code”

Regards,  
Pranav
