HW GRO Monitoring Process [PROD-1]

Introduction

The purpose of this document is to provide an overview of the monitoring process from IDeaS perspective. This document also identifies issues that may occur while monitoring and how to communicate these issues.

IDeaS Monitoring Activities

IDeaS is responsible for monitoring the process from Hilton’s placement of the extracts in the Designated Location through IDeaS placement of output files to the Designated Location to ensure that the BDE activities have taken place appropriately.

IDeaS is responsible for the following activities:

- Collection of placed Daily Extract from Hilton in Designated Location.
- Processing of Extracts
- Delivery of Output files to Designated Location for use by Hilton.
- Monitoring to ensure BDE/IDPs to be completed within SLA timeframe.
- Notifying GRO support before SLA in the event of an extract /s is/are missing.

[Update : August 31, 2020 PT]

Tools Required for monitoring

G3 RMS URL: <https://g3.ideas.com/solutions/api/auth/login>
CMA [Configuration Manager]: <http://us2p3ta01.ideasprod.int:8380/cma/>
FileZilla: <https://filezilla-project.org/download.php>
Hilton GRO-PROD: <http://aspscripts.ideasprod.int/hilton-gro-prod/>

G3 RMS Tool

For Hilton, typically, the BDE optimization window starts at around 09:00 AM IST and ends at 06:30 IST. So, the monitoring team will see data feeds coming in for processing by 09:00 AM IST.

Monitoring of extraction, processing and decision dispatch is primarily monitored using

“**Summary**” & “**Monitor By Exception**” screens. Typically, all the existing problems are flagged on “**Summary**” screen -> “**Claimed / Unclaimed**”

Problem & alerts/exceptions are generated on **"Monitor By Exception"** screen. Although, most of the problems and exceptions are flagged on these screens, however, there are few known limitations which are listed in this document later and thus, it is strongly recommended to use manual workarounds like running a report or a CMA query to overcome these limitations and improve the monitoring governance. One should start monitoring with **Monitoring Dashboard -> "Summary"** & keep checking **"Monitor By Exception"** screen with an interval of 30 minutes for alerts/exceptions.

The monitoring process and details about each module is as follows –

o **Monitoring Dashboard -> Summary**

o **Claimed/Unclaimed Problem Count By Job:-**

• **Claimed**

- These are the jobs on which the action has been or being taken.
- The purpose of claiming the job is to let others know not to action that job as the work is in progress.
- If you would like to know what action is being taken and by whom, you need to Click on the BAR representing the Claimed Job
- This will redirect you to the problems screen in which you will find details about the failed job such as –
 - Property code
 - Property Name
 - Client Code
 - Job Name
 - Step Name
 - Problem Description
 - Owner – The person who has taken action on that job and claimed it
 - Notes (if added) – Details as – Reference Email / Case Number
 - Unclaimed
- These are the jobs on which the action needs to be taken by the monitoring resource
 - The properties are grouped by job name.
 - Multiple properties can fail in the same job
 - Example – You can have multiple failures for OperaDataLoad Job. All the properties failed in that job will reflect under this.
 - If you click on any of the bar, it will re-direct you to "Problems" module and will display the list properties which are currently failed under this job.
 - To check further details regarding the failure, you can click on the "magnifier" icon as shown in the screenshot below –

Monitoring Dashboard

SummaryDOSProblemsSolutionsJobsStatisticsScheduleLocked PropertiesOPS PDPInput ProcessingMonitor By ExceptionRemote Tasks

Actions

Total Records: 1

Error Code	Property Code	Client Code	System Mode	Job Name	Step Name	Problem Description	Creation Date	Closed Date	Duration	Owner	SAS Server Name	External System
UNEXPECTED_ERROR	BOSES	Hilton	Decision Delivery Mode	Process CRS Extract CDP	CDROptimizationServiceStep	Error: The problem	11-Mar-2018 11:50:41 AM		00:07:37		mt5pg3sasv004.ideasprod.int	PCRS

- One should fully understand the issue and then take appropriate actions on the failure. References of the similar issues can be found in – • SFDC (with “Job Name” or “Error Details”)
 - CARE Knowledge Base (with “Key Words”)
 - Emails
 - If you do not find any reference in any of the above, or in case of any queries or questions with the content/description, please follow the standard internal escalation path for further details.
 - Internal Escalation Matrix: –
 - Product Engineer -> Senior Product Engineer -> ATL -> AM
 - If the count in unclaimed jobs is more than 100, then a task should be logged for QA team for further investigation.
- Problems -> Actions
 - Problems are “qualified” issues experienced with properties that need some action from the support team for resolution
 - A screen in G3 allows users to distinguish and identify all issues that need action from the support team.
- This action may include but not limited to
 - Problems
 - Resume
 - Resume is nothing but a RETRY
 - One can resume the failed job to check if the subsequent attempt is successful.
 - Depending on the Error/Exception generated, one should analyse whether the job should be resumed OR needs a different approach/action.
 - E.g. – Connection time out or I/O Exception – Can be resumed
 - Continue
 - This action will “SKIP” the existing step (failure step) and proceed with the subsequent step.
 - Thus, this action needs to be taken with “UTMOST” care and “ONLY” when there is a communication from technology teams (SD/QA/TechOps)
 - You can consult with Senior Product Engineer / ATL / Manager in case of any queries
 - Claim
 - The purpose of this action is to take ownership of that failed job
 - It indicates that the job is being investigated/worked by the person who claimed it.
 - The onus of resolving/taking action lies with the owner.
 - Release
 - This action is to release the claimed job from the ownership of the resource who claimed it.
 - Once you release the claimed job, it will be listed in the unclaimed jobs.
 - This will allow you to take the appropriate action necessary to resolve the issue.
 - Assign
 - This action allows you to assign the ownership of the job (claimed/unclaimed) to another resource.
 - Abandon
 - When a problem is abandoned, the associated job is forced into a non-running state.

- It has status of abandoned and thus cannot be started again.
- If there is a related regulator entry, it gets cleared and the next job is picked up by the regulator.
- The problem is closed
- Thus, this action needs to be taken with "UTMOST" care and "ONLY" when there is a communication from technology teams (SD/QA/TechOps)
- Notification
- Identification of issue and notification to client
- If the problem needs an action from Client OR in case of delay in scheduled optimization (per SLA) – Monitoring Team need to inform following contacts about the issue with details –

- TO: GRO.Support@Hilton.com
- CC: IDEaS DEPT: ET <ideasdeptet@sas.com>; IDEaS Dept: SPM <IDEaSDept_SPM@wnt.sas.com>; Care <care@ideas.com>

• Active Jobs by Name

- This section shows all active/ currently running jobs and count of properties (grouped by Job Name).
- This module is designed to give a quick idea about which jobs are currently running on Production and the count of jobs, so that monitoring team can analyse the processing load on production and take appropriate actions (if needed).
- In case of any queries or questions, please consult with Senior resources.

• Active Jobs by Status

- This module is very important from monitoring perspective as it classifies shows Active Jobs in following categories based on the time for which it is running –

• Overdue

- A job will reflect as "Overdue" if it is running for more than 60 minutes in the same step.
- So, monitoring team needs to review such jobs and take following actions –
- Stop / Resume (Need a review of the Overdue Job details)
 - If the issue persists – then abandon the job
 - Try to reprocess / re-trigger the same job.
 - If the issue persists – Abandon the job and send a notification to client with issue details.

• Failed

• Running

• Blocked

• Stopped

• Stopping

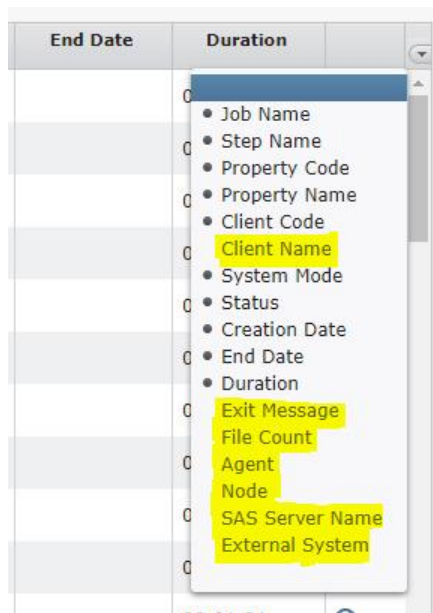

- **Monitoring team needs to identify the reasons for jobs which are in blocked or overdue and take appropriate actions accordingly.**

• Active Jobs by System Mode

- This module shows all Active Jobs by system mode and thus monitoring teams can easily identify the running jobs by System Mode for the highest to lowest priority properties and take appropriate actions accordingly.

Jobs

- One can view additional info associated with any job like File Count, Agent, Node, SAS Server Name, External etc. by going to –
- Under Monitor Dashboard -> Jobs -> Click on down arrow and select hidden columns.

- ABANDON or STOP – When you select either Stop or Abandon option for any Job, you will get two additional options:
- ABANDON after current step – this will allow the current step to complete and then abandon the job.

- ABANDON immediately – As the name suggests, this action will abandon the job immediately in the current step.
- STOP after current step – this will allow the current step to complete and then stop the job.
- STOP immediately – As the name suggests, this action will stop the job immediately in the current step.

- **CONTINUE** – This is important functionality and need to be used only after understanding the scenario.
 - This action will **“SKIP”** the existing step (stopped step) and proceed with the subsequent step.
 - Thus, this action needs to be taken with “UTMOST” care and “ONLY” when there is a communication from technology teams (SD/QA/TechOps)
 - You can consult with Senior Product Engineer/Associate Team Lead/Manager in case of any queries.

- Vital jobs will get highlighted if those are FAILED, STOPPED, STOPPING or OVERDUE. The color will depend upon whether it’s a CRITICAL job or an IMPORTANT job.

◦ Critical Jobs (Highlighted in Red)	Overdue highlight time in minutes
1. SeedDailyProcessingJob	6

2. NgiScheduledDataExtractJob	30
3. UploadDecisions	15
4. PullExtract	150
Important Jobs (Highlighted in Yellow):	Overdue highlight time in minutes
1. UploadCRSAcknowledgement	3
2. PullDecisionAcknowledgement	120
3. CrsFileArrivedMonitor	60

◦ **Monitoring Dashboard -> Monitor By Exception**

- As mentioned initially, all exceptions or alerts are generated on this screen. Monitoring teams needs to monitor this screen with an interval of 30 mins.
- Typically, during the BDE & CDP optimization window, the numbers/counts will be high in the initial phases.
 - For example
 - During 09:00 AM to 11:00 AM – the counts in “BDE_RECEIVED_OVERDUE” will show high count as the extracts pulling process is in process.
 - During 11:00 AM to 01:00 PM – the counts in “BDE_COMPLETED_OVERDUE” will show high count as the extracts processing/decision dispatch is in process.
 - However, monitoring teams needs to ensure that the counts are decreasing – If not – please consult with the seniors and escalate the issue to QA Team for further investigation.
 - Screen is logically divided into 2 sections: –
 - Screenshot –

◦ **Columns**

- These vertical columns represent the state that a property experiencing the issue is in. Meaning say a property X is in Decision delivery mode and experiencing an issue then it would appear in the column that reads Decision delivery mode. These are generally referred to as the phase/mode/stage of the property.
- More information about what each mode means is available here – http://ideas.na.sas.com/CS/Enterpriseteam/_layouts/15/WopiFrame2.aspx?sourcedoc=/CS/Enterpriseteam/Shared%20Library/INT_SystemMode.pptx&action=download&DefaultItemOpen=1
- Different modes and their brief meanings
- A full video of a detailed explanation is made available here - > www.sas.com/blogs/wp/ideas-news/2016/11/08/new-g3-rms-system-modevalues/

◦ **Rows**

- This describes the general ‘nature’ of the failure and is broadly categorized into the following sub categories
 - **AGENT_ALIVE_OVERDUE**
 - This is a section that captures all properties that are currently ‘not’ communicating with IDEaS servers whence they’re installed on an Agent.
 - Typically, there shouldn’t be any properties flagging under this section on Prod-1.
 - However, if you find any property flagging under this section, please immediately contact Senior

Product Engineer / Assi. Team Lead / Assi.
Technical Lead

- **BDE_RECEIVED_OVERDUE / CDP_RECEIVED_OVERDUE**
 - This section highlights properties where an extract (BDE / CDP) is not received to the IDeaS G3 Server. The G2 equivalent is 'Extract not received' in SWB.
 - Click on the count shown in the screen -> this will redirect you to "**Input Processing**" screen. If you want to verify the status -> Copy the property code and follow the steps mentioned below –
 - Now, there are two (2) scenarios –
 - If the file presented on SFTP however, not picked up and uploaded to IDeaS G3 Server, then the "File Status" will be shown the as "Incomplete"
 - In this case, we need to check the status of the scheduled job under Monitoring Dashboard -> Schedule -> "CRSFileArrivedMonitor" – the Job should ideally be running.
 - **If it is running**
 - Check the status for "pullExtractJob" under Monitoring Dashboard -> Jobs (Filter Criteria = "All Properties" & Start Date – 2 days back) – Please find sample screenshot below –
- **PullExtractJob**
 - **Not Running**
 - Escalate issue to Senior Product Engineer /ATL /Manager
 - **Running**
 - Ideally, it takes around one to ten minutes to complete (depending on the extract count).
 - If it is running for more than one hour – Click on the "Magnifier" – Check if the files are being uploaded to IDeaS G3 Servers
 - **Completed**
 - Click on the "Magnifier" – Check whether the file for the property (which is flagging under "Monitor By Exception") is uploaded to IDeaS G3 Server. – Please find sample screenshot below for your reference –

- **Overdue** (Running for more than 1 hour)
 - Escalate the issue to Senior Product Engineer/ ATL / Manager
- **Failed**
 - Try to RESUME
 - If it fails again – Abandon the job
 - Inform Senior Product Engineer / ATL / Manager to move the files manually from GRO PROD
 - Once the processing is completed, please verify the status by running a report/query from CMA – “Decision Delivery Metrics” to check if the BDE optimization is completed for all the properties – Ideally, BDE optimization should be completed for all Hilton Properties by 6:30 PM IST
 - If properties are pending for optimization (processing / decision dispatch)
 - Identify the list of properties which are pending
 - Inform following contacts about the delayed optimization with issue details –
 - TO: GRO.Support@Hilton.com
 - CC: IDEaS DEPT: ET <ideasdeptet@sas.com>; IDEaS Dept: SPM <IDEaSDept_SPM@wnt.sas.com>; Care <care@ideas.com>
 - **If it is not running**
 - Firstly, we need to identify the AgentID on which the property is configured: –
 - How to find agent associated to hilton property: –
 - Log in to G3 CMA & Run the query “Find Property Association with IDG Agent” as mentioned below: –

- Escalate the issue to QA Team after consulting with Senior Product Engineer /ATL / AM
- If the file is not presented on GRO Prod SFTP server, then please provide the list of properties to Peter C. via a task under Special Care
- monitoring case # 02893019 by 08:00 AM CST
- **BDE_COMPLETED_OVERDUE / CDP_COMPLETED_OVERDUE**
 - This section highlights properties where an extract is received, however, Processing/Decision Dispatch is pending. The G2 equivalent is 'Process Not Completed' OR 'Process Completed – Upload Pending' in SWB.
 - Monitoring team needs to check the current status of following Jobs –
 - **Extract And Analyze CRS File**
 - This Job analyzes the extract files received for the property – BDE or CDP depending on the Date/Time Stamp of the extract file
 - Now, depending on the optimization, system will run the optimization services (BDE / CDP).
 - Check how many jobs are currently running.
 - Depending on the status of the job, one needs to take appropriate actions as follows-
 - **Overdue** (running for more than one hour)
 - Check the step under job which is taking longer than expected time –
 - Try STOP & RESUMING that job
 - If the similar issue persists – please contact Senior Product Engineer -> ATL / AM – As this job may need to abandon and re-run – [NOTE: – This action needs to be taken with “UTMOST” care]
 - **Failed**
 - One should fully understand the issue and then take appropriate actions (RESUME / CONTINUE/ ABANDON) on the failure. References of the similar issues can be found in –
 - SFDC (with “Job Name” or “Error Details”)
 - CARE Knowledge Base (with “Key Words”)
 - Emails
 - If you do not find any reference in any of the above, or in case of any queries or questions with the content/description, please follow the standard internal escalation path for further details.
 - Internal Escalation Matrix: –

- Product Engineer -> Senior Product Engineer -> ATL > AM
 - If the issue persists and you anticipate that it would breach the SLA –
 - Inform following contacts about the delayed optimization with issue details –
 - TO: GRO.Support@Hilton.com
 - CC: IDEaS DEPT: ET <ideasdeptet@sas.com>; IDEaS Dept: SPM <IDEaSDept_SPM@wnt.sas.com>; Care <care@ideas.com>
- Completed BUT Running
 - There are few scenarios identified, wherein the job status is showing as "COMPLETED", however, one of the step is still running –
 - In such cases, you need to ABANDON such job and rerun the processing – However, it is recommended to take such actions with "UTMOST" care and needs approval from ATL / Manager
- **Process CRS Extract BDE / Process CRS Extract CDP**
 - This Job processes the extract file received for the property – BDE or CDP
 - Issues appearing here – please follow the same troubleshooting steps as mentioned in "Extract And Analyze CRS File"
 - One can verify the corresponding output file on GRO PROD to confirm the job completion status – <http://aspscripts.ideasprod.int/hilton-gro-prod/rec-summary.pl>
- **NGI Generate Datafeed File**
 - This Job creates DataFeed File on NGI.
 - Issues appearing – here please follow the same troubleshooting steps as mentioned in "Extract and Analyze CRS File"

G3 RMS Tool Limitations

DDS (Daily Decision Summary)

- As the name suggests, it gives Daily Decision Dispatch Status for all 2-way properties on Prod-1. Sample Screenshot –
- It shows, Total number of properties and the decision dispatch status
 - Completed
 - In Progress
 - Not Received [Extract not received]
 - Within 4 hours of SLA Violation – Properties which are taking more than 4 hours to complete the optimization and decision upload and thus, anticipated to breach the SLA.
 - SLA Violation – Properties which are taking more than 8 hours to complete the optimization and decision upload and thus, breached the SLA.
 - Please note that the counts are displayed based on the job status i.e. – Running / Completed.

◦

- Although, this module gives accurate status about the decision dispatch for all 2-way properties, however, it is strongly recommended that monitoring teams verify the status using “Decision Delivery Metrics” query/report from CMA at 06:00 PM IST and post CDP optimizations.

Statistics

- This module is mostly used for analyzing the past data, like, BDE Report, CDP Report, Daily Job Statistics, Job Statistics, Problem Statistics, and Hourly Job Statistics.
- However, this module has performance issues during peak hours of production – i.e. – 00:00 CST – 10:00 CST
- It has also been observed (in exceptional cases) that the schedules jobs like PullExtract / UploadDecisions / SeedDailyProcessing runs for longer time than expected. The jobs will get highlighted immediately when FAILED, STOPPED, STOPPING or in OVERDUE. (More info under JOBS section)
- Monitoring team needs to verify whether the job status is RUNNING or COMPLETED as shown in the screenshots below-

◦

-
- Thus, it is recommended to keep a check on the following screens –
 - Monitoring Dashboard -> Summary
 - Monitoring Dashboard -> Monitor By Exception
- Also, check the output of CMA report -> “Decision Delivery Metrics” after every three (3) hours during processing window & at 06:00 PM IST as this would allow you to check if the decisions are being uploaded to Hilton GRO PROD/SFTP.

CMA [Configuration Manager]

URL: <http://us2p3ta01.ideasprod.int:8380/cma/>

- Monitoring Team needs to run a report from CMA “Decision Delivery Metrics” at 06:00 PM IST (i.e. – 07:30 AM CST) to check if the BDE optimization is completed for all the properties by 6:00 PM IST – Ideally, BDE optimization should be completed for all Hilton Properties by 6:00 PM IST
- If properties are pending for optimization (processing/decision dispatch)
- Identify the list of properties which are pending
- Inform the following contacts about the delayed optimization with issue details: –
 - TO: GRO.Support@Hilton.com
 - CC: IDEaS DEPT: ET <ideasdeptet@sas.com>; IDEaS Dept: SPM <IDEaSDept_SPM@wnt.sas.com>; Care care@ideas.com
