CRS Extract (tar.z file)

A CRS Extract (also known as the tar.z file) is the HW extract that is picked up from Hilton's FTP site.

- tar.z files contain 8 files: .currency, .dmdlog, .gtd.method, .hostname, .rms_rates, .room_rates, .snap, and .yield.
- Property tar.z files populates in the Ratchet database and processed to create a T2Snap file. The T2Snap file is populated by the G3 RMS.
- **Inventory Data**
- Hotel & Room Type Inventory
- Out of Order and Manager Held Rooms
- SRP Definition – as Group or Transient
- **Rate Code Data**
- Rate Level and Rate Detail
- SRP Rate Detail
- Applicable Package Costs
- **Reservation Transaction and Occupancy Data**
- Reservation Transactions – New, Changes and Cancels
- Group Block – Summary and Room Type Level Daily File Pick Up Acknowledgement
- A Semaphore file is sent by IDEaS to the Hilton SFTP Server to indicate that the daily file is picked up

T2 Snap File

- The T2 SNAP file is the converted tar.z file that the G3 RMS uses.
-
- T2Snap files contain files:
- CSAT/CT/CTAT/GB/GM/PT/PTAT/PSAT level data
- CSAT=Current Segment Accommodation Type
- CT=Current Total
- CTAT=Current Total Accommodation Type
- GB=Group Block
- GM=Group Master
- PT=Past Total
- PTAT=Past Total Accommodation Type
- PSAT=Past Segment Accommodation Type
- Transaction levels data
- SRP's and BAR Rates level data

.Currency File

The Currency Conversion data file contains the currency conversion factors for all available currencies. In the snapshot below you will see that there are no headers for the data associated with this file.

.dmlog

The file '.dmdlog' is the file that contains the information pertaining to the Denial activity. Below is the snapshot of the '.dmdlog' file.

Denial Log with Header

Hostname

Hostname data contains only record type (host always) and system name as follows.

.rms_rates

The RMS Rates file is an XML file containing RMS rates. This file contains information reflecting contents of the srp_rmsrat table in the CRS database.

Room Rates

All the information pertaining to property room rates is received in this file

.Snap File

The snap file contains all of the records pertaining to the time stamp, headers, hotel totals, rate level totals, non-blocked SRP totals, blocked SRP totals, SRP group totals and trailer & transaction log indicator.

- There are various record types for a snap file as below. Details and headers pertaining to each are given in the file attached below.
-
- timestamp
- hothd
- hotel
- rtlvl

- srpcnt
- grpcvt
- srprm
- srpgrp
- exttype
- hottr
- tllog

We can determine whether the extract is BDE or IDP by below highlighted Part.

0= BDE

1= IDP

Rate Shopping Data Flow

IDG Agent- Integration Data Gateway

- It is similar to Subscriber Client in G2.
- In IDG global level jobs are scheduled such as
-

1)PullExtract

2)UploadDecisions

3)PullDecisionAcknowledgement

4)UploadCRSAcknowledgement

Where to See IDG Agent

IDG Configuration

Properties Assigned to IDG Agent

How to see which jobs are scheduled at IDG

- Properties are randomly mapped to IDG irrespective of property mode.
- There is no different IDG agent for Decision delivery mode, creation or population.
- When properties are installed on Prod-1, the properties get automatically assigned to the IDG agent which has lesser count of properties installed.
- IDG agent is dumb to understand whether the property is 2-way, 1way or population.
- IDG agent blindly runs all the job which are scheduled.

- Pull extract job will run and pull all the data available at SFTP and then pass it on to Rachet where it is converted into T2SNAP.
- If the property is 2 way then in process CRS Extract BDE we can see that the decisions steps are completed, if it is 1 way then the steps will be skipped.

How to Add New IDG Agent

- To add a new IDG agent we need to go to the Installation Tab.
- Click on IDG Agent.
- Click on Create IDG agent.
- Add IDG agent code and the client and select the external system.

Adding IDG agent is done by installation support team.

Current Agreed Flow with Hilton

Mcat Mapping

- Hilton's market segments are called MCAT (i.e. market categories). There was a problem found with some of Hilton's MCATs that contained many SRP's with a mix of attribute characteristics. IDEaS developed the MCAT+ solution for Hilton, which allows G3 RMS to assign business with the same MCAT and set of attributes to its applicable analytical market segment.
- IDEaS developed MCAT+ to allow the Ratchet database to be able to identify whether the SRP attributes within a Hilton market category (MCAT) on each booking needs to be replaced by a suitable sub market category. This determination uses two attribution-mapping tables; one detailing the derived attributes for all SRP records provided in the CRS data and the other detailing the attributes of all MCATS and Sub MCAT's.

Watch the below Video to understand things better-

https://help.ideas.com/g3rms_cp/Content/Market-Segments/Market-Segments-Best-Practices.htm

What is MCAT+ Solution?

- The MCAT+ solution was designed to segregate the heterogenous business (SRPs) hosted in the market categories DISC, MKT, IT, LNR and CNR
-
- These heterogenous market categories are split into sub market categories based on the different types of business they host
- This segregation of business helps in generating better forecast and decision.

SRP Configurations that define Markets Segments for Forecast Groups

CRS View of Rate Controls for SRP Attribution

Example of the SRP Attribution Table

The table indicates that an appropriate Sub MCAT, for reservations processed using the LDTG3N SRP ID after qualification of the SRP Attributes and their comparison to the Market Category Attribution table, is deemed to be DISC_QYL.

Definition of the Market Category Attribution Table

Default and unused MCAT

Discontinued SRP's

- For discontinued SRPs in the history file, Ratchet will replace the provided market category with MCAT specific default MS, denoting it as a history-related, non-attributed market segment. E.g., **LNR_HistNoAttrib** or **CNR_HistNoAttrib**.
-

SRP's with Missing Attributes

- For SRPs with missing attributes in a daily extract, Ratchet will replace the provided market category with a MCAT specific default market segment, denoting it as a future-related, non-attributed market segment, e.g., **LNR_FutNoAttrib** or **CNR_FutNoAttrib**

Hilton Outbound

Types of Hilton Decision Upload

Type of Decisions – BAR FPLOS by Rank

- Hilton has a standard Rate structure with LV0 to LV8 (Highest to Lowest)
- Based on the BAR decision generated by Analytics, we translate the decision to FPLOS for Upload.
- For e.g. The calculation is as shown below

:

Type of Decisions – LV0 Qualified FPLOS

- LV0 or Rate Level 0 is the highest rate Hilton has and it is used in multiple ways:
- Used as an unqualified rate plan
- Used as a qualified rate plan to generate room type restrictions
- Used as a label to send Hotel level overbooking
- GRO compares the LV0 rate with LRV, to generate Room Type restrictions
- For e.g. The calculation is as shown below:

Type of Decisions – Hotel (LV0) level Overbooking

- The Overbooking decision at the hotel level are sent against LV0.
- Below is a snippet of the Hotel Level Overbooking from the decision file:

Type of Decisions – Room Type level Overbooking

- Below is a snippet of the Room Type Level Overbooking from the decision file:

- The Decision file is placed in the SFTP location provided by Hilton
-
- Once the decision are delivered an acknowledgment is received which is processed in GRO
-
- The decisions are stored in the inventory history report along with the acknowledgment success/failure update

Job and Execution Step

Pull CRS Extract Job

Pull CRS Extract

HILTON+ NGI

Sending decision Via NGI to Hilton

1. In Hilton properties which we are sending decisions through NGI the IUPD Decision step will be skipped.
2. Start NGI Hilton Decision Delivery job step will be triggered.
3. This job will be triggered to all the Hilton properties for which below parameter is tuned on. "pacman.feature.HiltonStreamingDecisionEnabled"
4. The decision will be send in the message form to Hilton on their web service portal.
5. They do not have OXI interface or HTNG interface.
6. Integrations are working on receiving extract through NGI but that has not been finalized yet.
7. It is in pipeline and lot of discussion has been in the pipeline for this.
8. Currently there are 67 properties of Hilton for which we are sending decisions through NGI.
9. In the next deployment we will be trying to add more properties or all the properties.
10. And further this will be handed over to care for monitoring and a formal training will be provided to us on this.

Current list of Hilton properties for which we are sending decision as are attached below.
