Hyatt Property Monitoring Guidelines and Client Communication Protocol

Hyatt Property Monitoring Guidelines

Monitoring Criteria

In Hyatt monitoring, we only monitor properties for which the daily monitoring parameter is enabled, i.e., `pacman.monitor.DailyProcessingMonitoringEnabled` is set to true. This parameter indicates whether the property’s exceptions will be flagged in the MBE screen. By default, this parameter is set to false at the chain level. When system access is granted to the client (`pacman.feature.isPropertyReadyForExternalUser` is set to true), the above parameter is also enabled. Therefore, we only monitor the property when access is given to the client. Until then, we do not monitor the property. **This is specific to Hyatt only.**

Client Communication

For Hyatt, our focus is on reducing the number of client communication emails to enhance the client experience. We have implemented the following steps:

- For any failure related to User Action Alerts, such as ‘missing RT Alert’ or ‘Lowest/Highest decision check step alert’, it is the client’s responsibility to check and resolve these within the first 24 hours. Therefore, we do not send any notifications for these two failures during the first 24 hours. If the alert is not resolved within this period, we send a notification (using a standard email template) to inform the contacts about the alert.

Property Hosting Environments

Hyatt properties are hosted on multiple environments, including Hyatt Grid (Chicago), Oracle DC, and On-Premise. We maintain an Excel sheet with the location of the machine along with its grid. The list can be accessed [here](#).
