Per Person Pricing

Introduction and Objective

This document served as a resource for Service Delivery and Client Services to assist with enabling and supporting the Per Person Pricing functionality in G3 RMS.

Included are key topics from business use cases, sales qualification through to enabling the feature, what is required for configuration to add this functionality to G3 and what are the considerations from an analytics perspective.

- FEATURE/MODULE: Feature
- CHAREGABLE?: No

What does this feature do?

Without Per Person Pricing – IDEaS methodology is to derive the value of demand for the purposes of optimization from the Accommodation or Room Revenue (i.e. on a room only basis).

It is not appropriate to use the general ADR for the room to understand the value of demand for optimization purposes if the ADR is significantly different based on the number of people in a room.

Activating the person pricing feature has the following impact on system functionality:

■ Forecast

- G3 RMS weights the volume and value of demand by Occupancy Level. This serves as an appropriate input to the business optimization.

■ Optimize

- IDeaS currently optimizes on the basis of the Accommodation/ Room Revenues – total rate optimization will be required to achieve true PPP for resorts that split-out room and non-room revenues.
- The solution is able to optimize capacity on the basis of the occupancy type – e.g. if capacity is constrained in a Room Class – do we have sufficient demand from double occupancy rooms in order to reject or restrict the volume of Single Occupancy Rooms sold, as this has a big impact on total revenues.

■ Control

- Inventory Controls [LRV] – Managing the availability of rates sold, not only on the basis of the their “rate value” but also with an appreciation of how the per person pricing impacts the optimization of this control.
- Pricing – Pricing is optimized on the basis of two adults. This allows us to support two potential options:
 - Prices that differ significantly between occupancy types.
 - Prices that have the same base price up to a higher occupancy type e.g. the base price is not two adults and thereafter the extra adult offsets apply but the extra adult offset should only apply from 5 adults for example.

At this time: The basis of the pricing is still the room revenue value, therefore all-inclusive properties’ business practices need to be considered very carefully to determine suitability.

Analytics

Adjustments to analytics processes:

- The 2 Adult rate will be the base for optimization (rather than a base rate being an overall average as it is in the current per Room Pricing Model)
- Reservation Transaction data (Analytics_Trans Table) will be used by analytics to weight the volume and value of demand by occupancy bucket for each Forecast Group and Room Class combination; based on the occupancy buckets configured in Rooms Configuration
 - E.g. If a Room Type can accommodate up to 2 Adults and 3 Children, analytics will weight – how much demand exists for each occupancy bucket and the value of that demand:
 - 1 Adult, 0 Children
 - 1 Adult, 1 Child
 - 2 Adults, 0 Children
 - 2 Adults, 2 Children
 - 2 Adults, 3 Children
- When producing pricing: G3 RMS will consider the calibrated weights for each occupancy bucket and set the optimal base price for 2 adults; whilst accounting for the demand in other occupancy buckets. For example:
 - How many rooms will be sold for 1 Adult and the value of that demand based on offsets; how much will be sold to 1 adult and 1 child and the value thereof etc.
- When producing Last Room Value (LRV): The overall value of demand will now be weighted based on the occupancy bucket expectations by Forecast Group.

This means that where it is more valuable to sell Rooms to higher occupancies, LRV may rise above the price offered to lower occupancies to protect the inventory for more valuable (higher) occupancy patterns.

TO BE ADDED : any misnomer's – if there are/were any 'incorrect assumptions' about the suitability of PPP for a client or business need

Business Use Cases & Qualification Steps

1. This feature is a key requirement to provide an effective solution for clients operating an All Inclusive pricing strategy.
2. It also ensures G3 RMS has a good understanding of the value of demand for a property – where the value of demand varies significantly depending on the number of occupants in the room

Per person pricing can be used if one or both of the scenarios below exist for room types (or all room types in the property):

1. The base pricing is based on the number of occupants, not the room type having a base price with small incremental supplements
 1. E.g. an extra 25-50% is added for each adult beyond 2 rather than a small amount e.g. 20.00 on a rate of 200.00, as is common in properties that price per room with small additional supplements.
 1. Note: What is key is the % of the base price i.e. how much will this dilute the value of demand as occupants are added (especially if the room can and commonly is sold to a large number of additional occupants). Often in per room-based pricing properties: The number of additional occupants that can be accommodated is also very small and hence the dilution impact may be small.
2. The base pricing is not based on 2 adults but a higher number e.g. the base price includes up-to 4 adults and then additional adult supplements are added

At this time: The basis of the pricing is still the room revenue value, therefore all-inclusive properties' business practices need to be considered very carefully to determine suitability.

Please refer to the below Knowledge Universe Post for more information:

[Per Person Pricing, All Inclusive or Resort Properties in IDEaS Solutions](#)

Qualification

Ideally, clients will be able to tell the Sales team if they operate a per person or per unit selling strategy.

- “ All Inclusive – For additional information please see [here](#).
- “ Operating a Per Person Pricing Strategy

o Only pricing is per person i.e. there is no price for 'the room'

- A base price is for 1 or 2 adults and then the supplements for extra adults in the room are significant values as compared to the base price
- A room is priced based on e.g. 5 adults regardless if occupancy is under and extra adult rates are charged thereafter

Sales Discovery Questions

Please advise how you price for children:

- Do you have one price for a child to stay? (if yes please advise age considered a child)
- Or do you have different prices for different age ranges? – if so please share the details
- And/or is the price different for the 1st child, 2nd child etc. Please provide details

Please advise how you price for additional adults:

- Is single or double the base price?
- Is there then one price for an additional adult?
- Or is the price different for the 3rd Adult, 4th Adult etc. Please provide details

Example from Data provided previously by clients?

ROA can conduct analysis to see if

We would need to get a picture of how they price (similar to the example above if simple or the example shared for Iberostar if more complex formulae are used (which is typical in PPP/ All-inclusive hotels). This would help us prioritize any upload enhancements required and also support CS as they prepare for the projects.

Integrations Supported

INBOUND: All integrations that provide IDeaS with the number of occupants for each reservation are supported.

OUTBOUND: Some integrations may have limitations in the number of Extra Adult/Extra Child values/buckets that can be received.

Integrations that support Daily BAR decisions can accept PPP but how the pricing is calculated could vary by integration. See section – 'How does the content of Decision Delivery change?'

IMPORTANT NOTE: Per Person Pricing can only be enabled for properties with Continuous Pricing.

How does the content of Decision Delivery change?

OPMS Agent	- We can only send 1 Ad, 2 Ad, Extra Ad and Extra Ch or Child Age buckets. <u>S-Group</u> were the beta for Child Age Buckets which is the only different output.
RMS PMS / NewBook (e.g. Holiday Parks)	Support delivery of 1 ad, 2 ad, extra ad and extra child, so the RMS behaves differently to calculate pricing but we do not send anything new i.e. as per Opera above.
SynXis	We send a distinct price for Adults > 2 if the prices will differ for adults beyond 2 i.e. the additional adult supplement does not just apply from the 3rd adult onwards. SEE EXAMPLE BELOW

SYNXIS EXAMPLE: If I price the 2nd additional adult different to the 3rd or if the base price is based-upon 5 adults and therefore the same price needs to be sent (second example below). @ 22 July 2019 We have no client using this with SynXis. Hence Alpha test will be required.

AgeQualifyingCode="10" = Adult

AgeQualifyingCode="8" = Extra Child

EXAMPLE: if I price the 2nd additional adult different to the 3rd adult etc.

<BaseByGuestAmts>

<BaseByGuestAmt NumberOfGuests="1" AgeQualifyingCode="10"
AmountAfterTax="150.00" />

<BaseByGuestAmt NumberOfGuests="2" AgeQualifyingCode="10"
AmountAfterTax="170.00" />

<BaseByGuestAmt NumberOfGuests="3" AgeQualifyingCode="10"
AmountAfterTax="185.00" />

<BaseByGuestAmt NumberOfGuests="4" AgeQualifyingCode="10"
AmountAfterTax="200.00" />

<BaseByGuestAmt NumberOfGuests="5" AgeQualifyingCode="10"
AmountAfterTax="225.00" />

</BaseByGuestAmts>

<AdditionalGuestAmounts>

Extra adult/ child values above the specific values populated above:

<AdditionalGuestAmounts>

<AdditionalGuestAmount AgeQualifyingCode="8" Amount="5.00" />

</AdditionalGuestAmounts>

<AdditionalGuestAmount AgeQualifyingCode="10" Amount="15.00" />

EXAMPLE: if the base price is based-upon 5 adults

<BaseByGuestAmts>

<BaseByGuestAmt NumberOfGuests="1" AgeQualifyingCode="10"
AmountAfterTax="225.00" />

<BaseByGuestAmt NumberOfGuests="2" AgeQualifyingCode="10"
AmountAfterTax="225.00" />

<BaseByGuestAmt NumberOfGuests="3" AgeQualifyingCode="10"
AmountAfterTax="225.00" />

<BaseByGuestAmt NumberOfGuests="4" AgeQualifyingCode="10"
AmountAfterTax="225.00" />

<BaseByGuestAmt NumberOfGuests="5" AgeQualifyingCode="10"
AmountAfterTax="225.00" />

</BaseByGuestAmts>

<AdditionalGuestAmounts>

Extra adult/ child values above the specific values populated above:

<AdditionalGuestAmounts>

<AdditionalGuestAmount AgeQualifyingCode="8" Amount="5.00" />

</AdditionalGuestAmounts>

<AdditionalGuestAmount AgeQualifyingCode="10" Amount="15.00" />

Implementation Phase

The Per Person Pricing functionality should ideally be added in the project phase:
Rooms Configuration / Pricing Configuration.

Back End Configuration (IDeaS)

Activation of Per Person Pricing:

1. **Support -> Configuration** – parameter for this functionality is as shown in the below screenshot – feature.PerPersonPricingEnabled

Note:

- Currently, this functionality is enabled only for 'Big4 Parks' and 'RAC Parks'.
- This functionality is supported only for 'Continuous Pricing' properties.
- This functionality is not supported for LDB properties.
- This is a chargeable activity, and will be enabled only upon confirmation from Sales, CPM and CRM teams.

If activating after initial Implementation Phase

No Rollback and Catchup is required as activation of the parameter populates the analytics tables with the required data.

User Configuration in G3 RMS

After IDeaS has activated the parameter....

Rooms Configuration – This feature allows the users (clients) to configure their maximum occupancies by room type just as it is done in the PMS by clicking on the Add Maximum Occupancy option as shown in the screenshot below –

A window will pop-up where the maximum occupancy can be filled in. The screenshot of this pop-up is as follows –

Room Type	Max	Adults	Children
DAES	2	2	0
DBL	2	2	0
DDES	2	2	0
DDEX	2	2	0
KAES	2	2	0
KDEX	2	2	0
KNES	2	2	0
KNEX	2	2	0
KING	2	2	0
QN	2	2	0

Save Cancel

Clients would follow the same process which is followed in any CRS or PMS to fill in these details.

3. Pricing Configuration offsets –

A] ADULTS – For any room types that support 3+ Adults – users would be able to choose if they wish to add additional rules. These rules are only required if there are pricing differences.

For example, if the 3rd adult in the room has a different rule than the 4th and so on.

Note – *If the 'Extra Adult Supplement' applies to each adult beyond 2, the above stated rules are not required.*

Steps required –

1. In G3 RMS, on the Pricing Configuration screen, users will click on the option available on the top right corner called as 'Occupancy Value Grouping'.
2. Users will then select the maximum number of adults where pricing is defined before the additional offset applies. Below is the screenshot for the same –

Values for additional adults can be overridden by the clients as shown in the below screenshot –

Note – *In the above screenshot, the values are the addition charged on the base rate per adult. (viz, how much more is required to be charged per adult greater than 2 in percent.)*

B] CHILDREN –

There are two options for the clients to price for children:

- By Age bucket of the child
- By number of children (similar to adult pricing)

Steps required –

1. Click on the option of ‘Occupant Value Grouping’ as shown above.
2. Choose an approach to pricing children amongst the below.
3. A] If pricing is done by ‘Child Age bucket’, then the client will define pricing for each child bucket. Please note that currently only 3 buckets are available and supported for daily rates. Below is the screenshot for the same –

B] If pricing is done by occupancy type, then the client will define pricing for those occupancy buckets (similar to the above age bucket).

What outputs does User see in G3 RMS User interface?

No change in the UI other than above configuration items.

See section ‘How does the content of Decision Delivery change?’

What is covered in Education/Coaching?

Covered in OLC....1/3/,,, need to loop in with E2.

Other info to call out/considerations in Onsite coaching..?

Configuration of Client’s Selling Systems to Receive this feature from G3RMS

DETAIL TO BE PROVIDED

Including outputs of this feature in Decision Upload

There’s no configuration of this nature required. If the feature is active, then the outputs will be of the required format.

IDeaS Backend Parameters for Decision Upload

There is no configuration of this nature required. If the feature is active, then the outputs will be of the required format

Client Spot Checking effective delivery into Receiving Systems

DETAIL TO BE PROVIDED

FAQ's

Does LRV functionality change?

The LRV calculated for that room class/type will be influenced by the weighted demand that the system wants to capture. By understanding how much demand there is for 1 adult / 1 adult + 1 child / 2 adults / 2 adults +1 child etc... the system can optimize that demand based on the remaining capacity and set the LRV accordingly. Then in the selling system – the value of the room will be calculated based on the number of adults and children and that is then compared to the LRV for availability as per normal hurdle functionality.

Where it is more valuable to sell Rooms to higher occupancies, LRV may rise above the price offered to lower occupancies to protect the inventory for more valuable demand.
