Statistical Outlier Alerts

Introduced two new Alerts –

- **LowestBarFplosCheckFail** – Configuration Parameter for this alert are

- 1.pacman.feature.LowestBarFplosChecks
- 2.pacman.feature.StatisticalMonitoringEnabled

For all arrival date from System Date to BDE days (365) if only lowest rate is open than this alert is generated.

- **HighestBarFplosCheckFail** – Configuration Parameter for this –

- 1.pacman.feature.HighestBarFplosChecks
- 2.pacman.feature.StatisticalMonitoringEnabled

For all arrival date from System Date to BDE days (365) if LV1 is closed and only highest rate (LV0) is open than this alert is generated.

Pre-Requisites –

If Statistical Outlier alerts has Read/Write Access than Property Should be in Decision Creation Mode

What actions to be taken if LowestBarFplosCheckFail and HighestBarFplosCheckFail is generated:

Following two options to resolve these alerts, the screenshots are below

If the client chooses the option 1 – Ignore Once for this period and upload the decisions.

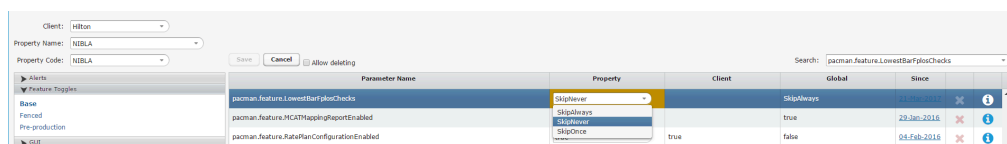

Then the system will ignore this Alert once and will upload the decision.

No manual intervention required (like re-trigger the job is not required).

If the client chooses the option 2 – Do not upload the decisions. I will open a case.

The client itself will open a case to IDEAS, then IDEAS will need to confirm from the Client that weather they want to –

1. Ignore once this alert and upload the decisions –Then IDEAS need to set **SkipOnce** for pacman.feature.LowestBarFplosChecks.
2. Ignore always this alert and upload the decisions–(Not recommended from IDEAS as the system will never check for this Alert if this option is selected)- Then IDEAS need to set **SkipAlways** for pacman.feature.LowestBarFplosChecks.
3. Never ignore this alert while uploading decisions –Please refer the below screenshot for setting values in config parameter screen for LowestBarFplosChecks-Then IDEAS need to set **SkipNever** for pacman.feature.LowestBarFplosChecks.

Parameter Name	Property	Client	Global	Since		
pacman.feature.LowestBarFplosChecks	SkipNever		SkipAlways			
pacman.feature.MCATMappingReportEnabled	SkipAlways	true	true	29-Jan-2016		
pacman.feature.PataPlanConfigurationEnabled	SkipOnce	true	false	05-Feb-2016

- 1) Is this limited to fplos decision types only?
- 2) What is LV1 and what is LV0 in this case?
- 3) In either cases if the client is asked to choose the 2nd option why does the client have to open a case? Why the hotel not make a decision on their own – because in either cases (whether CARE/IDEAS does it OR Hotel does it whilst resolving the error) the outcome is uniform – meaning objective is

to review decision and action all pointers that contribute to an erroneous/ near flat /non dynamic decisions. Why the intervention from IDEaS? Why can't the client make choices for themselves for their own product?

1) Is this limited to fplos decision types only?

Answer – Yes this is for Fplos by Rank decisions only.

2) What is LV1 and what is LV0 in this case?

Answer – LVO is the highest rate and LV1 is the second highest rate.

3) In either cases if the client is asked to choose the 2nd option why does the client have to open a case? Why the hotel not make a decision on their own – because in either cases (whether CARE/IDEaS does it OR Hotel does it whilst resolving the error) the outcome is uniform – meaning objective is to review decision and action all pointers that contribute to an erroneous/ near flat /non dynamic decisions. Why the intervention from IDEaS? Why can't the client make choices for themselves for their own product?

Answer – We have provided the second option so as to check whether the decision actually got failed due to the Highest / Lowest Bar FPLos got generated on all occupancy dates and then we (IDEAS) can let them know that why Alert is generated.
