System Performance

Case Query:

- **A particular screen/module is invisible**
 - We have to first try whether we can access the screen or module
 - If yes:
 - We have to find the reason why client is not able to see the same:
 - We may want to check User Access rights through: Authorizations> User Management> Role Management, check if the user has rights to access a particular module or not.
 - Also check if the User access rights are updated in the back-end with the help of QA
 - Check whether the parameter for that particular module is enabled for the client or not. For Eg. If a client reports that he/she is not able to run the “Group Evaluation”, we can check if the parameter associated is enabled or not through Support> Configuration> Property Level> Check the concerned parameter
 - If no:
 - Check the corresponding G3 RMS Parameters, to ensure that they are updated appropriately for the module to be active
 - For e.g:
 - Escalate it to IDEaSG3 QA (Should include the preliminary investigation)
 - Client response:

- We should include the screenshot where we can access the module or screen.
 - If the issue is due to user rights, we may ask the client to liaise with the user having System CEO rights (Corporate user)
 - Recommended settings: Login into the UI>Hover on to the User information on to the top right corner of the screen>Click on “Recommended settings and Versions”
 - We may ask the client to go to chrome://settings/content>Check the box “Allow sites to run Flash” under Flash Tab if the issue is related to fetching a specific module.
- **System Not Up To Date**

Follow the processing issue monitoring, resolution, and response process. Follow this link.
 - **After carrying out a specific task like override and uploading the decision, the screen hangs**
 - Try to reproduce the issue.
 - If we encounter the same, we may want to escalate it to QA with all the required details and preliminary investigation
 - In case we do not encounter the same issue, it corresponds to system specific issue and in that we have to go back to the client with below mentioned details:
 - Could you please provide us a screenshot of Recommended Settings and Versions. Please find attached screenshot for your reference.
 - You’ve mentioned that the Google Chrome version is 51.0.2704.106 m however the latest version is Version 53.0.2785.143 m, so is it that
 - you have ‘not’ set Google Chrome to Auto Update? If yes, could you please install the latest version?
 - Additionally, could you also follow the below steps-
 - Click the menu in the top left and select History (or press Ctrl+H)
 - Click on Clear browsing data.
 - Check the following options and un-check all other options:
 - i) Clear Browsing History
 - ii) Clear Download History
 - iii) Empty the cache
 - d. Ensure that the popups for the URL ideas.com are enabled. To manually allow pop-ups from a site, follow the steps below:
 - Click the Chrome menu on the browser toolbar. Select Settings. Click Show advanced settings. In the “Privacy” section, click the Content settings button. In the “Pop-ups” section, click Manage exceptions.
 - Once you’ve performed all the steps, could you please try performing an override/remove an override from the Suite room class and confirm if it’s working as expected.
 - **Log in Issues/ Group Evaluation Issues**
 - Try to reproduce
 - If the issue persists: escalate it to QA
 - If not then go back to the client with system recommended settings
 - Client may raise a concern that while doing an activity it took more than usual time like:
 - “I have attempted to run a group evaluation. I timed it and the system took 4.35 mins to complete the evaluation for a single date for 20 rooms. This seems EXTREMELY slow compared to other properties”

- We can check or ask the client to configure all seasonal floor/ceiling rates. (There is a defect raised for such type of cases " DE4928")
 - We may want to reproduce. If successful, we can inform the client, otherwise have to escalate it to QA
- When trying to evaluate new groups, the message "Another process is currently running. Please try later":
 - We may include below mentioned points while going back to client in our response if the issue allows:
 - This case presented an unusual data condition which we wanted to ensure is fully understood to be able to resolve this. It has been observed that today's rate shopping feed/data took longer than expected to process and thus the subsequent process (Group Evaluation) was stuck in queue.
 - Please note that whenever a Group Evaluation is run, it triggers a miniature Optimization like what happens during BDE and IDP. Those optimizations are performed by a server running the SAS operating system and using the G3 RMS analytics package and code. The error 'Another process is currently running. Please try later' is intended to indicate that the evaluation has been saved however the G3 interface running in your browser can't connect to the SAS server because of the above explained issue.
 - We have noticed that as soon as the rate shopping process was completed, the Group Evaluation was picked up by the system and processed successfully. We would greatly appreciate if you could please verify from your end and update us accordingly.
- While running the Group Evaluation, client get the error "Unable to Successfully call SAS for a Group Evaluation"
 - This issue is intermittent and we can go back to the client and include the below mentioned points in our response:
 - Please note that we have investigated the reported issue based on your inputs and below are our observations.
 - We would like to inform you that the error encountered by you was intermittent and you should be good to run Group Evaluations if tried again.
 - We need to check first: Further, I have monitored our system and observed that Group Evaluations ran successfully for multiple users.
- **System is in Read Only Mode**
 - We have to investigate why the system is in RO mode
 - Then we can go back to the client with the below mentioned points:
 - Reason: We can see that for the property "The Godfrey Hotel", there was a manual decision upload triggered at the same time when the CDP processing was in progress
 - Unfortunately, the CDP processing took longer than expected due to which the system was in read only mode..
 - Resolution: Further we can see that all the processing are completed successfully and system is out of read-only mode.

- **BDE/CDP optimization did not run**

- First validate the issue raised by the client and perform the basic troubleshooting:
 - Check the Job Status
 - Check for any system outage
 - Respond to client accordingly with valid details

- **System is slow**

- We need to validate
 - Validation will include verification of the client's statement as per the below mentioned set benchmarks published by QA (Screen shot needs to be included ask Sunny)
 - If we see the concerned module or screen is uploading as per the expected benchmark
 - Client Response: We need to inform the client that the said module is working as expected with valid proofs and if required we can ask for the client's system specification and investigate further with the help of QA in case the client reverts.
 - If not then we need to liaise with QA and involve the CRM/CPM with all the required details (Client's system specification and preliminary investigation steps). CPM/CRM needs to be involved to make the client aware about the investigation.
- Client response should have the Investigation steps and escalation information if required.
